

WEEKLY_EXERCISE_PEER_REVIEW_AND_REFLECTION_TEMPLATE

V3.0.6

STUDENT_NAME: Alex Morgan

STUDENT_ID: 12345678

EXERCISE_NUMBER: 3

SECTION_1

Write your review for each peer.

PEER_REVIEW_1

REVIEWER_NAME: Alex Morgan

REVIEWEE_NAME: Jamie Taylor

ATTEMPTED_AND_DEMONSTRATED

Guiding question: *Has your reviewee attempted and demonstrated the required exercises?*

ATTEMPTED_AND_DEMONSTRATED_RESPONSE (Yes / No): Yes

CODE_FUNCTIONALITY

Guiding question: *Describe what is working and what is not working in your peer's code.*

CODE_FUNCTIONALITY_RESPONSE: Jamie completed tasks 2–4. Her feedback form catches the POST data and redisplay it, and her server-side validation correctly rejects an empty Name and a Rating outside 1–5. The form also keeps the entered Name after a validation error. The one gap was that a blank Comments field wasn't handled — it saves an empty comment without warning.

SUBMISSION_QUALITY_AND_CODE_READABILITY

Guiding question: *Describe the quality of your peer's submission: What is done well? What could be improved? How readable and clean is the code?*

SUBMISSION_QUALITY_AND_CODE_READABILITY_RESPONSE: The code is clean and the POST-handling block is easy to follow. It could be improved by grouping the repeated validation checks together rather than scattering them, and by adding a short comment above each check. Readability is good overall.

DEMONSTRATION_AND_EXPLANATION_QUALITY

Guiding question: *Describe whether the demonstration and explanation are clear and easy to follow. Did your peer show good understanding of their work?*

DEMONSTRATION_AND_EXPLANATION_QUALITY_RESPONSE: Clear and confident. Jamie explained why client-side validation isn't enough and walked through how the POST request is processed. She showed a solid understanding of why `htmlspecialchars()` is needed in the value attribute, not just in the output.

MUTATION_TEST

Guiding question: *Briefly describe the mutation test the reviewee was asked to do, and the outcome of the mutation test.*

MUTATION_TEST_RESPONSE: We asked Jamie to change her server-side validation so the Rating maximum is 10 instead of 5, and to show the form still keeps the Name after an error. She edited the if-condition and re-tested in about a minute; the Name field was preserved correctly. Done without AI.

CONSTRUCTIVE_COMMENTS

Guiding question: *Provide constructive suggestions to help your peer improve their work and professionalism. You may also include positive encouragement and note anything you learned.*

CONSTRUCTIVE_COMMENTS_RESPONSE: Your XSS handling was convincing and preserving the Name value on error is exactly right. To improve, add a one-line comment above each validation block stating what it guards against, and handle the empty-Comments case. Thanks for explaining why the value attribute also needs escaping — I hadn't considered that.

PEER_REVIEW_2

REVIEWER_NAME: Alex Morgan

REVIEWEE_NAME: Riley Bennett

ATTEMPTED_AND_DEMONSTRATED

Guiding question: *Has your reviewee attempted and demonstrated the required exercises?*

ATTEMPTED_AND_DEMONSTRATED_RESPONSE (Yes / No): Yes

CODE_FUNCTIONALITY

Guiding question: *Describe what is working and what is not working in your peer's code.*

CODE_FUNCTIONALITY_RESPONSE: Riley completed all tasks. His search.php uses GET correctly and echoes "You searched for: ...", and he demonstrated how the term appears in the URL. His feedback form validates and sanitises input properly. Everything worked; no broken behaviour that I could see.

SUBMISSION_QUALITY_AND_CODE_READABILITY

Guiding question: *Describe the quality of your peer's submission: What is done well? What could be improved? How readable and clean is the code?*

SUBMISSION_QUALITY_AND_CODE_READABILITY_RESPONSE: Good quality. Collapsing the search into a single field was clean. One improvement would be to trim the search term before matching so trailing spaces don't cause a miss. Variable names are clear and the file is easy to read.

DEMONSTRATION_AND_EXPLANATION_QUALITY

Guiding question: *Describe whether the demonstration and explanation are clear and easy to follow. Did your peer show good understanding of their work?*

DEMONSTRATION_AND_EXPLANATION_QUALITY_RESPONSE: Easy to follow. Riley clearly explained the difference between GET and POST and why search naturally uses GET. He showed good understanding of how the request data reaches his script.

MUTATION_TEST

Guiding question: *Briefly describe the mutation test the reviewee was asked to do, and the outcome of the mutation test.*

MUTATION_TEST_RESPONSE: We asked Riley to rename the search parameter from “query” to “keyword” and update the PHP that reads it. He changed both the form field and the request() lookup, re-tested, and explained what changed in the URL. Completed without AI.

CONSTRUCTIVE_COMMENTS

Guiding question: *Provide constructive suggestions to help your peer improve their work and professionalism. You may also include positive encouragement and note anything you learned.*

CONSTRUCTIVE_COMMENTS_RESPONSE: Clean, well-organised work. To improve, trim the search input and consider a “no results” message when the term isn’t found. Your GET-vs-POST explanation was the clearest in the group and helped me tidy up my own search page.

(Add additional reviews if you are assigned to review more than 2 students,)

SECTION_2

Paste the full, original reviews from your group members below. Do not make any modification to the reviews you have received.

REVIEW_1

REVIEWER_NAME: Jamie Taylor

REVIEWEE_NAME: Alex Morgan

ATTEMPTED_AND_DEMONSTRATED

Guiding question: *Has your reviewee attempted and demonstrated the required exercises?*

ATTEMPTED_AND_DEMONSTRATED_RESPONSE (Yes / No): Yes

CODE_FUNCTIONALITY

Guiding question: *Describe what is working and what is not working in your peer’s code.*

CODE_FUNCTIONALITY_RESPONSE: Alex completed all tasks. His validation rejects empty and out-of-range input, and his XSS demo showed the attack running and then being blocked once htmlspecialchars() was restored. Everything worked as intended.

SUBMISSION_QUALITY_AND_CODE_READABILITY

Guiding question: *Describe the quality of your peer's submission: What is done well? What could be improved? How readable and clean is the code?*

SUBMISSION_QUALITY_AND_CODE_READABILITY_RESPONSE: Well organised and readable. The validation logic is a little repetitive and could be pulled into a small helper. Otherwise clean and consistent.

DEMONSTRATION_AND_EXPLANATION_QUALITY

Guiding question: *Describe whether the demonstration and explanation are clear and easy to follow. Did your peer show good understanding of their work?*

DEMONSTRATION_AND_EXPLANATION_QUALITY_RESPONSE: Very clear. Alex explained the request lifecycle well and I learned a cleaner way to echo old input safely from watching his demo.

MUTATION_TEST

Guiding question: *Briefly describe the mutation test the reviewee was asked to do, and the outcome of the mutation test.*

MUTATION_TEST_RESPONSE: We asked Alex to temporarily remove `htmlspecialchars()` from the Comments output, submit `<script>alert('x')</script>`, then restore it. He completed it without AI and explained why the escaped version renders the text safely.

CONSTRUCTIVE_COMMENTS

Guiding question: *Provide constructive suggestions to help your peer improve their work and professionalism. You may also include positive encouragement and note anything you learned.*

CONSTRUCTIVE_COMMENTS_RESPONSE: Thorough work and a convincing XSS demo.
Suggestion: make your error messages name the field that failed (e.g. "Rating must be 1–5") so they're friendlier to the user. I picked up the safe old-input pattern from your demo — thanks.

REVIEW_2

REVIEWER_NAME: Riley Bennett

REVIEWEE_NAME: Alex Morgan

ATTEMPTED_AND_DEMONSTRATED

Guiding question: *Has your reviewee attempted and demonstrated the required exercises?*

ATTEMPTED_AND_DEMONSTRATED_RESPONSE (Yes / No): Yes

CODE_FUNCTIONALITY

Guiding question: *Describe what is working and what is not working in your peer's code.*

CODE_FUNCTIONALITY_RESPONSE: Alex implemented all tasks correctly. The validation and sanitisation both work, and his search page handles GET properly. No broken behaviour observed.

SUBMISSION_QUALITY_AND_CODE_READABILITY

Guiding question: *Describe the quality of your peer's submission: What is done well? What could be improved? How readable and clean is the code?*

SUBMISSION_QUALITY_AND_CODE_READABILITY_RESPONSE: Neat and easy to read; good use of whitespace. The repeated validation checks could be grouped into one function so feedback.php reads more cleanly.

DEMONSTRATION_AND_EXPLANATION_QUALITY

Guiding question: *Describe whether the demonstration and explanation are clear and easy to follow. Did your peer show good understanding of their work?*

DEMONSTRATION_AND_EXPLANATION_QUALITY_RESPONSE: Thorough and confident. Alex explained the reasoning behind each step and clearly understands how the request data flows into his script.

MUTATION_TEST

Guiding question: *Briefly describe the mutation test the reviewee was asked to do, and the outcome of the mutation test.*

MUTATION_TEST_RESPONSE: We asked Alex to remove `htmlspecialchars()` from the Comments output and submit a `<script>` tag to show the XSS, then put it back. He did it without AI and clearly explained why escaping stops the script running.

CONSTRUCTIVE_COMMENTS

Guiding question: *Provide constructive suggestions to help your peer improve their work and professionalism. You may also include positive encouragement and note anything you learned.*

CONSTRUCTIVE_COMMENTS_RESPONSE: Solid work across all tasks. One improvement: group your validation checks into a small function so the main file reads more cleanly. Your GET/POST explanation was the clearest in our group.

(Add additional reviews if you are assigned more than 2 reviewers)

SECTION_3

Reflection_on_This_Week's_Peer Feedback

LEARNING_FROM_EXERCISE

Guiding question: *What have you learned from completing this week's exercise?*

LEARNING_FROM_EXERCISE_RESPONSE: I learned how to validate input on the server and keep the form's state after an error, and why client-side checks aren't enough on their own. Running the XSS attack on my own form made the need for `htmlspecialchars()` concrete.

FAIRNESS_OF_COMMENTS

Guiding question: *Do you think the reviewers' comments are fair? Why or why not?*

FAIRNESS_OF_COMMENTS_RESPONSE: Yes. Both reviewers pointed to specific things — my error messages not naming the field, and my validation being repetitive — and after re-reading my code I agree with both.

USEFULNESS_OF_COMMENTS

Guiding question: *Were the reviewers' comments useful? Why or why not?*

USEFULNESS_OF_COMMENTS_RESPONSE: Very useful. Riley's suggestion to move the validation into a small function is something I hadn't considered and will make feedback.php much cleaner. Jamie's point about field-specific error messages will improve the user experience.

IMPROVEMENT_BASED_ON_FEEDBACK

Guiding question: How will you use the reviewers' comments to improve your work, process, or professionalism?

IMPROVEMENT_BASED_ON_FEEDBACK_RESPONSE: Next exercise I'll factor the repeated validation into a helper function, make each error message name the field, and add short comments above each check. The mutation test also showed me I lean on AI for small edits more than I realised, so I'll keep practising making changes myself.

SECTION_4

Reflection_on_AI_Feedback

(Note: This part is to be completed starting from Week 2 Exercise review onwards)

Part A

Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	2	3	4	5

Q1. The AI feedback I received this week was fair and unbiased.

Q1_SCORE: 4

Q2. The AI feedback provided clear and specific guidance.

Q2_SCORE: 4

Q3 The AI feedback helped me improve how I review or evaluate my peers.

Q3_SCORE: 4

Q4. I would rely on AI feedback in future assessments if it is accurate, specific, and unbiased

Q4_SCORE: 4

Q5. The AI feedback helped me better understand the assessment criteria.

Q5_SCORE: 5

Q6 The AI feedback was too generic to be useful.

Q6_SCORE: 2

Part B

Q7 In what ways did the AI feedback influence your learning or peer reviewing this week?

Q7__RESPONSE: It flagged that my earlier reviews were a bit generic, which pushed me to reference specific tasks and code this week rather than just saying "good work".

Q8. What aspects of the AI feedback did you find most helpful or relevant?

Q8__RESPONSE: It was specific about which of my review sections lacked detail, so I knew exactly what to fix next time.

Q9. What could be improved in the AI feedback to make it more effective or fairer?

Q9__RESPONSE: A short example of a strong constructive comment would help me see the standard it expects.
