

Reviewee Reflection Instruction

Reflecting on feedback and learn from it is how student could develop themselves to become an independent lifelong learner.

You need to read the feedback written for you by your peers and reflect on this. Your reflection needs to address the following:

1. What have you learnt from completing this week's exercise?
2. Whether you think the reviewers' comment is fair or not, and provide reason.
3. Whether you think the reviewers' comment are useful or not, and provide reason.
4. How would you take the reviewers' comment to improve your work/process/professionalism?

Examples reflection:

We had a discussion about the server vs client side input and we were talking about the possibility of injecting script into the text input forms that would run. This was interesting and brought up some good points about the importance of validation/sanitisation. I also realised that I had combined a few of the tasks again which would better be split into the individual tasks but they all have the same functionality. I think the commenters are fair but I did fix the piece of code that wasn't working regarding the error handling. All of the error handling for task 5 is working as intended. I had the right functionality but the logic was overwriting one of the errors. Would be good to get some feedback if they are actually understanding the code but due to the simplicity and knowing the content already it is unclear whether I am able to explain in an effective manner.

I learn how to use the seeder and migration from Laravel. I also learn how to use the Model and controller, much easier than what had done before. Their comments are valid, indeed I need to rewatch some part of the lectures to have a better understanding of the command line and the seeder part. I will do a refresh to make sure that my database is clean. And I keep all that advice for the other weeks.

1. I learnt a lot about Laravel throughout the workshop and I found this content really interesting, though when it comes to the peer review task, I can't say I learnt too much, we picked up on an error I made, but the inputs and review process I didn't really learn anything from. Though, I can say that I learnt that php sections or blocks appear a lot less in these files.

2. They were completely fair, Reviewer 1 pointed out in his review that I made an error with task 2 at first and this was because I left in a section that looked like this

```
<?php
```

```
$_POST["name"]
```

I can't remember if that's exactly how it looked since I removed the code to make the auto increment work, but I appreciated that they managed to point that out. Otherwise, the feedback was positive, and I reckon it's fair.

3. Their feedback isn't necessarily useful, not because they're bad but because they're not constructive criticism, so therefore I can't really take what they've said and improve on anything. However, I will note that their comment during the review process was helpful when they pointed out the reason why my auto increment in task 2 wasn't working.

4. Just like I said in 3, because they're not constructive criticism, I can't really take these

comments to improve my work and my processes. Though I will keep in mind to read my code even more thoroughly to ensure what is causing issues, such as the auto increment in task 2, so this is something ill keep in mind and question whether or not I need a php section or not in my html.
